

The Rise of the Working Married Woman: Evidence from U.S. Teachers in the 1930s

Amy Kim and Carolyn Tsao

September 28, 2023

Introduction

- ↑ in women's LFP driven by married women ▶ Women in LF
 - Married women grew from 5.6% of LF in 1900 to 25.8% in 2000
- Key barrier: “**marriage bars**” prevented employment of married women
 - Firm-level ‘**hire**’ and ‘**retain**’ bars
 - Enforced by over half of surveyed firms in 1931 Goldin 1988
 - In 1950's, demand for labor rose \Rightarrow marriage bars were ‘lifted’.
- Limited work on marriage bars. Goldin 1988, 2021
 - We are the first to estimate **causal** effects of lifting marriage bars on LF outcomes.
- **Our focus:** Marriage bars in teaching

Research question

What were the effects of lifting marriage bars on...

① Workforce composition?

- LFP of married women, unmarried women, men
- **Today's Talk:** Lifting marriage bars ↑ share of married women in teaching; ↓ share of unmarried women

② Household outcomes?

- Fertility, household labor supply
- **Today's Talk:** Preliminary work suggests no effects on # children; husband's occupation

③ Firm outcomes?

- Productivity, wages
- **Next Steps:** Digitizing salary data and school-level outcomes

Research question

What were the effects of lifting marriage bars on...

① Workforce composition?

- LFP of married women, unmarried women, men
- **Today's Talk:** Lifting marriage bars ↑ share of married women in teaching; ↓ share of unmarried women

② Household outcomes?

- Fertility, household labor supply
- **Today's Talk:** Preliminary work suggests no effects on # children; husband's occupation

3. Empirical Strategy
4. Preliminary Results
5. Next Steps

Our context: Marriage bars in teaching

- Teaching: key job for married, educated women [▶ Married Women in Teaching](#)
 - In 1940: 31% of married women in labor force with any college were teachers.
 - In 2000: 12% of married women in labor force with any college were teachers.
- Marriage bars were **highly prevalent** in teaching.
 - 87% of school districts in 1942. Goldin 1988
- **Identifying variation:** NC and KY lift marriage bars earlier than neighbors

[▶ Treatment Map](#)

Data

- Census:**
- Every 10 years (full-count, linked)
 - Occupation, earnings (1940), gender, marital status

- State Superintendent Reports:**
- Every year
 - District-level teacher salaries, school spending, # students, rural/urban

Outline

1. Introduction
2. Data and Context
3. Empirical Strategy
4. Preliminary Results
5. Next Steps

Strategy: Differences-in-differences design

Compare treated counties to control counties: [Treatment Map](#)

$$y_{ct} = \alpha_t + \beta_{s(c)} + \sum_{k \in \{1910, 1920, 1940\}} \gamma_k \times \text{Treat}_{s(c)} \times \text{Year}_{k=t} + \varepsilon_{ct}, \quad (1)$$

where for each county c and year t ,

- $\text{Treat}_{s(c)} = \mathbb{1}[s(c) \in \{\text{KY}, \text{NC}\}]$
- Outcome y_{ct} : Share teachers married women, unmarried women, men.

Identifying assumption: Parallel trends in y_{ct} if marriage bars had not been lifted.

Outline

1. Introduction

2. Data and Context

3. Empirical Strategy

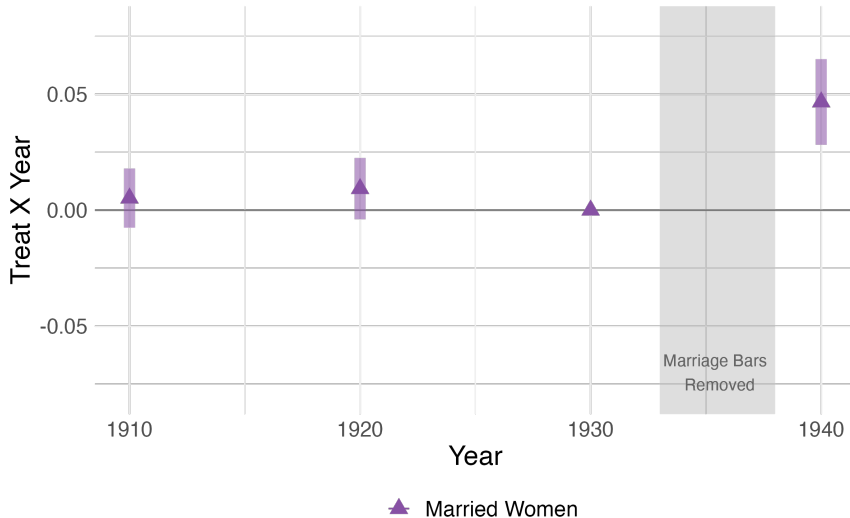

4. Preliminary Results

- Effects on workforce composition

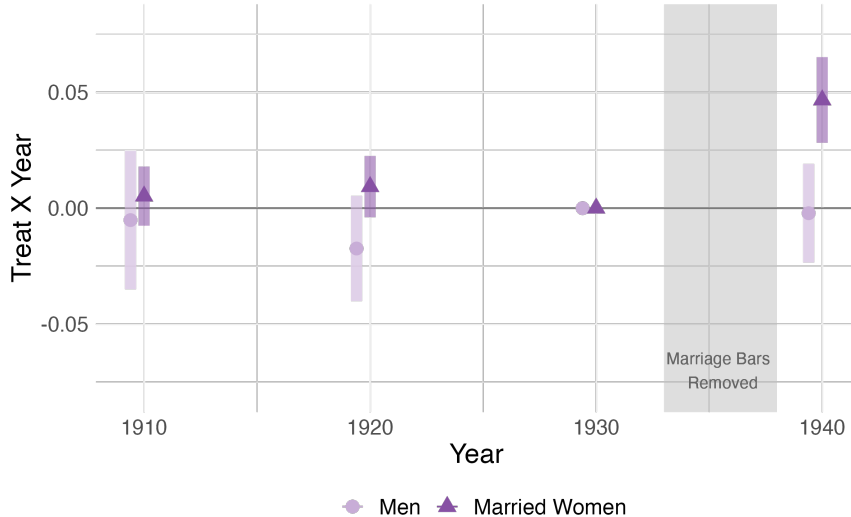

- Effects on household, firm outcomes (Work in progress)

5. Next Steps

Result: Treated states see \uparrow in share married women teachers

Result: Men are *not* pushed out by marriage bars being lifted

Result: Men are *not* pushed out by marriage bars being lifted

Decomposing the main effect

- 'New' married women teachers fall into one of two groups:

- **Which group** drove \uparrow married women teachers in treated vs. control states?
- **Strategy:** 2-period diff-in-diff with outcomes share teachers MB and MA

Result: \uparrow in both newly hired and newly married women

Result: \uparrow in both newly hired and newly married women

Preview of Ongoing Work: Household Outcomes

- **No effect** of lifting marriage bar on husband's occupational score [▶ Graph](#)
- **No effect** of lifting marriage bar on number of children [▶ Graph](#)
- Future work: mechanisms (composition vs. outcome of entry) w/ linked Census

Outline

1. Introduction
2. Data and Context
3. Empirical Strategy
4. Preliminary Results
5. Next Steps

Next Steps

This project so far:

- Marriage bars **“had bite”**: Lifting bars caused \uparrow share married women teachers.
- Increase driven by **both** new entry and marriage
- No effect on household characteristics/outcomes

Next steps:

- Characterizing the married women employed after marriage bars are lifted.
- Digitizing teacher salary data pre-1940.
- Additional outcomes: educational attainment, school funding
